

SUPPLEMENTARY INFORMATION

Supplementary Figure 1. HadCRUT3 instrumental annual global mean surface temperatures 1850-2007 smoothed on 40 year and longer timescales based on the simple Matlab procedure (solid curves) and the multiple taper approach (dashed curves) as discussed in the main text. Results are shown for (i) the full interval 1850-2007 (black) and the shorter intervals (ii) 1850-1987 (green) and 1850-1967 (red). Note that the two methods (i.e. corresponding pairs of solid and dashed curves) yield smoothed curves that are only barely discernible from each other [To approximate a 40 year cutoff period in the multiple-taper approach, the following time-frequency bandwidth parameters were used: $NW=4$ for 1850-2007 and 1850-1987, corresponding to 39.5 year and 34.5 year period half power points respectively, and $NW=3$ for 1850-1967, corresponding to a 39.3 year period half power point].

Supplementary Figure 2. Weights on each of the three smoothing constraints (blue=minimum norm, green=minimum slope, red=minimum roughness) for 40 year smoothing of HadCRUT3 instrumental annual global mean surface temperatures back to 1850 as a function of the terminal year of the interval, which is varied from 1927 to 2007.

Interval #	Interval	ϵ^2 (minslp)	ϵ^2 (mpad)	ϵ^2 (adapt)	ϵ^2 (minslp/adapt)	ϵ^2 (mpad/adapt)
